Foreword

This Management Guideline is a summary of outputs completed within the GRDC Project RDP00013 ‘The integration of technical data and profit drivers for more informed decisions’. This national project is being delivered across all 14 major grain growing agro-ecological zones in Australia through the collaborative partnering of five consulting organisations.

The Management Guideline aims to assist growers to understand key drivers of profit in their agro-ecological zone, and compare their business to benchmarks in order to identify areas of potential development. In addition, there is scope to assist growers in implementing effective strategies to improve efficiencies and boost business financial performance. There is evidently a distinction between knowledge of technical data and the implementation of this data between the Top 20% business and the average business. This has been a focus point in the development of this Management Guideline.

A consistent message from the project is that in each agro-ecological zone there exists a large gap in financial performance between the Top 20% businesses and the average business. There appears to be genuine opportunity for many grain growers to increase profit

from the resources that they currently have available to them.

This particular guideline has been prepared by Corporate Agriculture Australia Pty Ltd on behalf of the Grains Research & Development Corporation.

Please Note: A detailed description of the profit drivers and analysis can be found in the major report ‘RDP00013: The integration of technical data and profit drivers for more informed decisions’.

Disclaimer & Seasonal Influence

Disclaimer

This report has been produced by Corporate Agriculture Australia Pty Ltd (herein referred to as “the Company”) and associated consultants/specialists. Whilst all due care has been taken in collecting, collating and interpreting information in this report, some interpretation may be subjective. The statements and opinions contained in this report are given in good faith and in the belief that they are not false or misleading.

Neither the consultant nor the Company undertakes responsibility in any way whatsoever to any person (other than the Client) in respect to the document, including any errors or omissions therein, arising through negligence or otherwise however caused.

This report is copyright. No part of it may be by any means reproduced or stored in a retrieval system, or transmitted without prior permission of the Company.

Seasonal Influence

The data collected and analysed in this management guideline booklet was collected for the three year period between 2011 – 2013. The seasonal conditions experienced over these years will have had an influence over the results achieved in each agro-ecological zone. If seasonal conditions differ from those experienced during this time period, some of the comparisons within and between the zones and regions may change. All information and recommendations presented in this publication should be treated as a guide only and it is strongly recommended that professional financial advice is sought to ensure correct interpretation of the data presented.

GRDC:

Any recommendations, suggestions or opinions contained in this publication do not necessarily represent the policy or views of the Grains Research and Development Corporation (GRDC). No person should act on the basis of the contents of this publication without first obtaining specific, independent professional advice.

The GRDC will not be liable for any loss, damage, cost or expense incurred or arising by reason of any person using or relying on the information in this publication.

Executive Summary

To understand the key management influenced profit drivers that can be identified through quantitative analysis, a comparison has been made of the actual medium-term results of the Top 20% performing businesses in each zone to the average level of performance achieved across the dataset in each zone. In the Western Region, the Top 20% of businesses have been selected by long term Operating Return on Production Assets (ORPA). This measure may also be known as Return on Assets Managed (ROAM) in other datasets. Return on Equity (ROE) is an alternative measure that could validly be used, however ORPA provides a better indication of return on assets managed (including lease land) without the influence of capital growth.

There are four primary profit drivers that have been identified as driving long term financial performance. These are;

i. Gross Margin Optimisation

The Top 20% of businesses in this zone are generating 2% more income per effective hectare and spending \$20 less per hectare on variable costs. As a result, the Top 20% of businesses are generating a 12% greater gross margin per effective hectare.

ii. Low Cost Business Model

The Top 20% are significantly more efficient in machinery and labour utilisation (as measured through a TPML benchmark), retaining an additional 1.25% of turnover as potential net profit before tax. The Top 20% are also investing less into machinery per dollar of income, and accessing lease land 33% more cost effectively.

iii. People & Management

The Top 20% are generating 3% more turnover per full time employee, and subjectively managing

a more timely and efficient business.

iv. Risk Management

Difficult to quantify, but from conducting qualitative studies, the consistent theme of the Top 20% is that they are able to manage a more resilient business by actively identifying and mitigating production and business risks.

By understanding and proactively managing the four primary profit drivers, the Top 20% businesses are retaining 7% (relative) more profit as a percentage of income compared to the average business.

*The Top 20% are retaining
7% more profit as a % of
income*

Agro-ecological zone description

In 1998, the GRDC classified Australia's grain growing zones into 14 major agro-ecological zones. These zones are listed and outlined in the map below.

- Qld Central
- SE Qld & NE NSW
- SW Qld & NW NSW
- NSW Central
- NSW-Vic Slopes
- Vic High Rainfall
- SA & Vic Mallee
- SA Mid North Lower York Eyre
- Tas Grain Growing
- WA Northern
- WA Central
- WA Eastern
- WA Sandplain
- WA Mallee

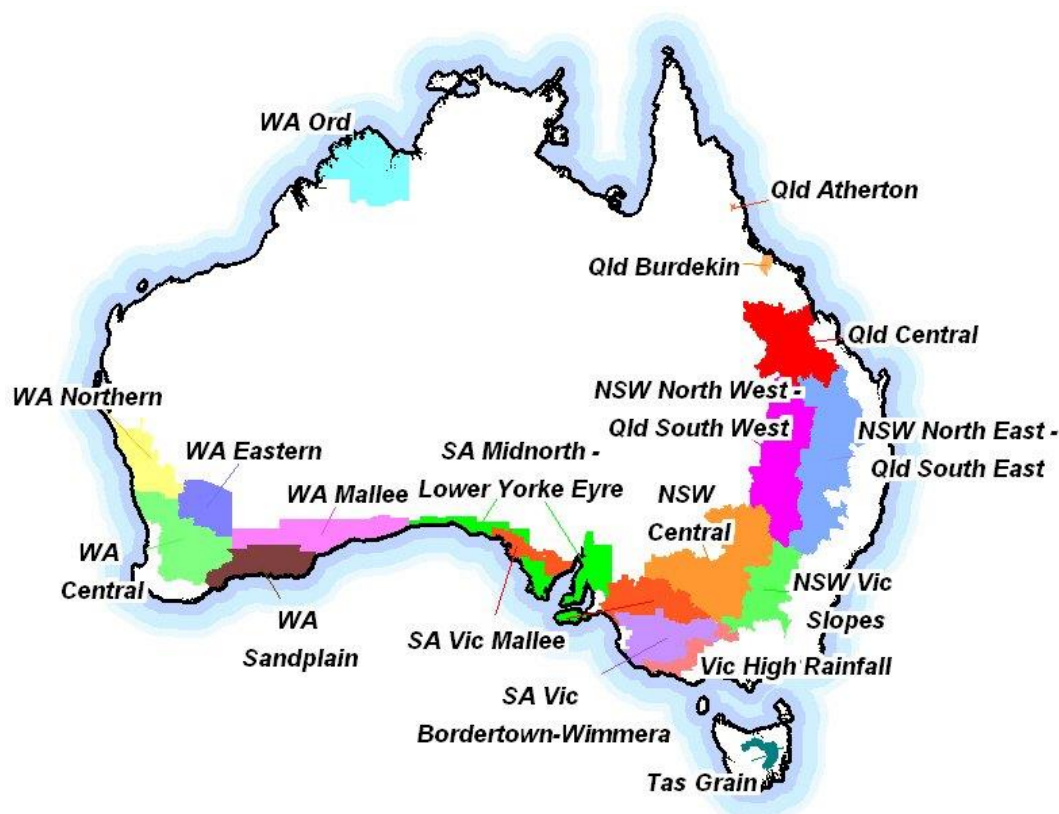

Figure 1: The 14 major agro-ecological zones within the Australian grain growing regions as classified by the Grains Research and Development Corporation.

WA Central agro-ecological zone

This is the largest agro-ecological zone in the Western Region, in terms of both total area and croppable area. This zone covers more than 9.5 million hectares, of which over 3.6 million hectares are suited to cropping enterprises.

Figure 2: A map of the WA Central agro-ecological zone.

Other key features include;

Soil Type	Gravelly sands/loams, to sandy/loam duplexes, to sandy earth soils
Rainfall	<p>Growing Season is typically April to October</p> <p>Annual Rainfall indications:</p> <p>Dandaragan – 600mm 89% falls in growing season</p> <p>Brookton – 450mm 85% falls in growing season</p> <p>Pingrup – 360mm 74% falls in growing season</p>
Typical Yield	<p>Wheat – 1.5t/ha to 4.0t/ha. Dataset 3yr average is 2.53t/ha</p> <p>Barley – 1.5t/ha to 5.0t/ha. Dataset 3yr average is 2.50t/ha</p> <p>Canola – 0.7t/ha to 2.5t/ha. Dataset 3yr average is 1.19t/ha</p>
Enterprises	<p>78% average cropping intensity across the datasets</p> <p>24% cropping only businesses</p> <p>76% mixed cropping and livestock businesses</p>
Average Farm Size	3,776 hectares across the datasets captured (effective land)
Land Values	Land values range from \$1,250/ha to \$3,600/ha (arable)

In the WA Central zone, the Top 20% of Businesses own 43% additional effective land area than the average, and manage (owned + leased/sharefarmed) 32% more

land. In terms of cropping percentage of effective ha managed, the Top 20% are cropping 10% greater area than the average.

How do the Top 20% and The Average compare in overall performance benchmarks?

Benchmark	Average across WA Central dataset	Average of Top 20% as selected by ORPA*	Difference	
			+/-	%
Return on Assets Managed (R.O.A.M.)*				
a. Op. Return on Prod. Assets	8.63%	13.33%	4.70%	54.5%
Return on Equity (R.O.E.)*				
a. R.O.Farm E.*	17.60%	16.72%	-0.88%	-5.3%
b. R.O. Business E.*	10.99%	15.93%	4.94%	44.9%
Profit (BT) as a % turnover	22.47%	24.09%	1.62%	7.2%

Table 1: WA Central performance benchmarks.

The following observations can be drawn from the above table;

- ① The Top 20% are generating an ORPA* that is 4.7% stronger.
 - This represents an additional \$47,000 in operating net profit per annum for every \$1 million in assets managed
- ① The average business is returning nearly 1% more ROFarmE*.
 - This is mostly attributed to two individual business in the dataset average that lease the majority of their land, and own little. This results in disproportionately high returns, and in some years disproportionate negative returns, however in the three year period of data collection, two of these years have been excessive highs.
 - To further explain this, if these two outliers were removed from the analysis, the average business ROFarmE* would reduce to 12.19%; more in-line with what would be expected.
- ① The Top 20% are retaining 1.6% more turnover as net profit before tax.
 - This results in an additional \$16,000 in net profit before tax per \$1 million in turnover per annum being retained

It can also be noted that some businesses in this agro-ecological zone are retaining in excess of 30% of turnover as net profit before tax.

* The data collected and analysed in this management guideline booklet was collected for the three year period between 2011 – 2013. The seasonal conditions experienced over these years will have had an influence over the results achieved in each agro-ecological zone. If seasonal conditions differ from those experienced during this time period, some of the comparisons within and between the zones and regions may change.

Figure 3: Summary of selected key benchmarks and ratios for the WA Central agro-ecological zone.

ORPA = Operational Return on Production Assets*

GM Ratio = Gross Margin to Income Ratio

Profit as % Income = Profit as a percentage of Income

* The data collected and analysed in this management guideline booklet was collected for the three year period between 2011 – 2013. The seasonal conditions experienced over these years will have had an influence over the results achieved in each agro-ecological zone. If seasonal conditions differ from those experienced during this time period, some of the comparisons within and between the zones and regions may change.

Calculating your ORPA

Operating Return on Production Assets (ORPA)

$$= \text{Farm Operating Profit} \div \text{Total Farm Production Assets}$$

(Operating profit before interest & tax.
Excludes capital growth)

= _____

The Profit Drivers

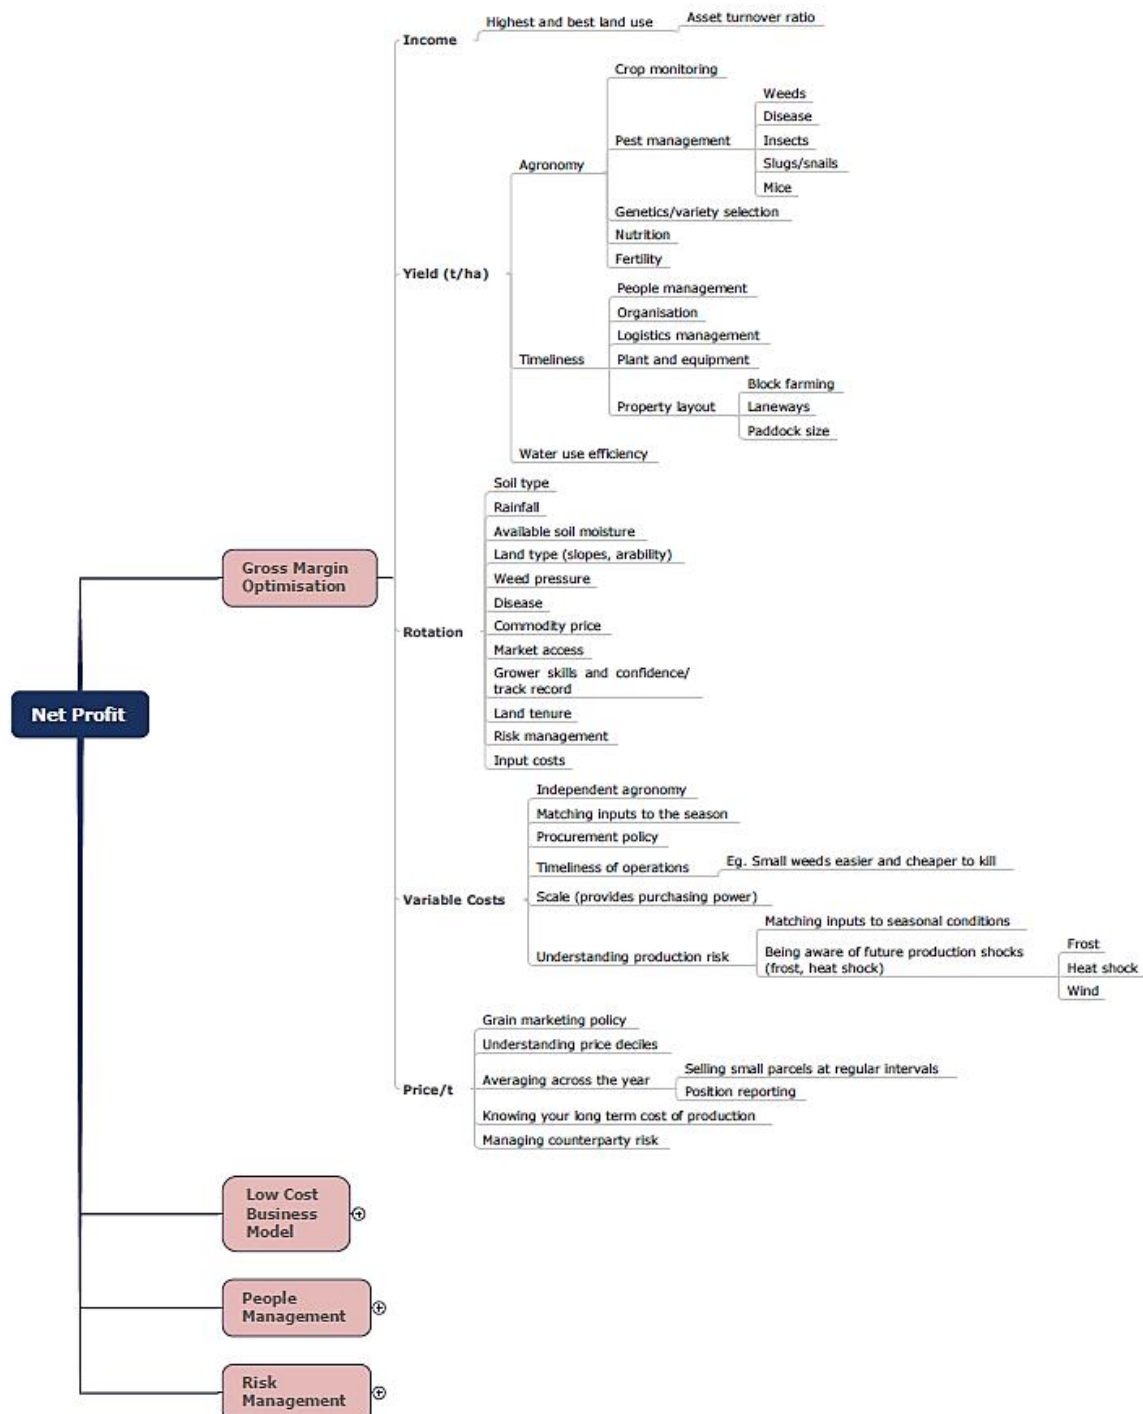

Through analysis of grower information and datasets Australia wide, it has been established that there are four primary profit drivers that can influence the profitability of every farm business. These include;

- i. Gross Margin Optimisation
- ii. Low Cost Business Model
- iii. People and Management
- iv. Risk Management

Within these four primary profit drivers, there are a number of secondary and tertiary profit drivers that influence them. By identifying, validating, and quantifying these secondary and tertiary profit drivers, we can understand which have the greatest influence on profitability per agro-ecological zone. Ultimately, this understanding can become a powerful objective tool to extend to growers to help improve their financial performance over time.

The Gross Margin Optimisation primary profit driver is influenced by five key secondary profit drivers, including total

farm income, crop yield, crop rotation, variable costs, and commodity price received.

Benchmark	Average across WA Central dataset	Average of Top 20% as selected by ORPA	Difference		Your Benchmarks
			+/-	%	
Hectares Owned	2,353	3,369	1,016	43.2%	
Total Effective Ha (owned + leased/sharefarmed)	3,776	4,992	1,216	32.2%	
Total Cropped Ha	2,949	4,300	1,351	45.8%	
Cropping % (of eff.Ha)	78.09%	86.14%	8.05%	10.3%	
Asset turnover ratio <small>*income/total business assets</small>	0.33	0.31	-0.02	-6.4%	
Income per eff.Ha	\$646.45	\$657.52	\$11.07	1.7%	
Complete rotation (\$/Ha/mm AR)					
a. Income as \$/eff.Ha/mm AR	\$1.67	\$1.78	\$0.11	6.6%	
b. Income as \$/eff.Ha/eff.mm	\$2.46	\$2.70	\$0.24	9.8%	
WUE Wheat (kg/ha/eff.mm)	12.26	12.94	0.68	5.5%	
Price received Wheat (\$/t)	\$274	\$283	\$9	3.3%	
Yield Wheat (t/ha)	2.53	2.51	-0.02	-0.8%	
Variable Costs \$/Crop Ha	\$339.18	\$318.81	-\$20.37	-6.4%	
Variable Costs as % income <small>*includes, contract work, crop selling and storage, crop insurance, fertiliser, freight, fuel, ameliorants, machinery R&M, seed & seed cleaning, chemicals</small>	52.47%	48.49%	-3.98%	-8.2%	
Fertiliser \$ per cropped ha	\$94	\$79	-\$15	-19.0%	
Pesticide \$ per cropped ha	\$57	\$54	-\$3	-5.6%	
Gross Margin per eff.Ha	\$317.72	\$356.52	\$38.80	12.2%	
Gross Margin (\$/Ha/mm AR)					
a. Op. GM as \$/eff.Ha/mm AR	\$0.80	\$0.93	\$0.13	16.3%	
b. Op. GM as \$/eff.Ha/eff.mm	\$1.16	\$1.38	\$0.22	19.0%	

Table 2: WA Central Gross Margin Optimisation benchmarks.

In WA Central, the Top 20% of businesses by ORPA;

- ① Are generating 2% more income per effective hectare than the average.
 - As a result, are making 10% more income per effective hectare, per effective mm rainfall (\$/eff.Ha/eff.mm) than the average business
- ① Have 5.5% better water use efficiency on wheat.
- ① Expend \$20.37 less per hectare (or 6%) on variable costs than the average.
- ① Are investing 48.5% of turnover into variable costs compared to the average 52.5%.
 - Therefore are 8% more efficient with variable costs as a % of income, resulting in an additional 4% of income potentially being retained as net profit before tax
- ① Are generating a 12% greater gross margin per effective hectare than the average (\$356.52 to \$317.72 respectively)

- When analysed further, are achieving a 19% greater gross margin per effective hectare, per effective mm rainfall (\$/eff.Ha/eff.mm) than the average business
- Partly a result of the Top 20% average rainfall being lower than the average of the zone
- Attributed to greater efficiencies in variable cost control, and water use efficiency outcomes

Price received per tonne and yield are often considered by growers to be the key profit drivers in their business...however from analysing the data captured this is not the case. A disciplined approach to improving gross margins is the key.

Variable Costs breakdown

The Top 20% of businesses by ORPA;

- ① Are spending 19% less on fertiliser than the average business
 - Equivalent to \$15 per cropped hectare
 - The average of the WA Central dataset receives a higher annual rainfall than the average of the Top 20%, indicating that the better performing businesses are in the

more medium rainfall band of this zone. The dominant soil types of the group average indicate a higher potassium requirement; hence higher expenditure than the Top 20%

- ① Are expending 30% less on machinery R&M than the average

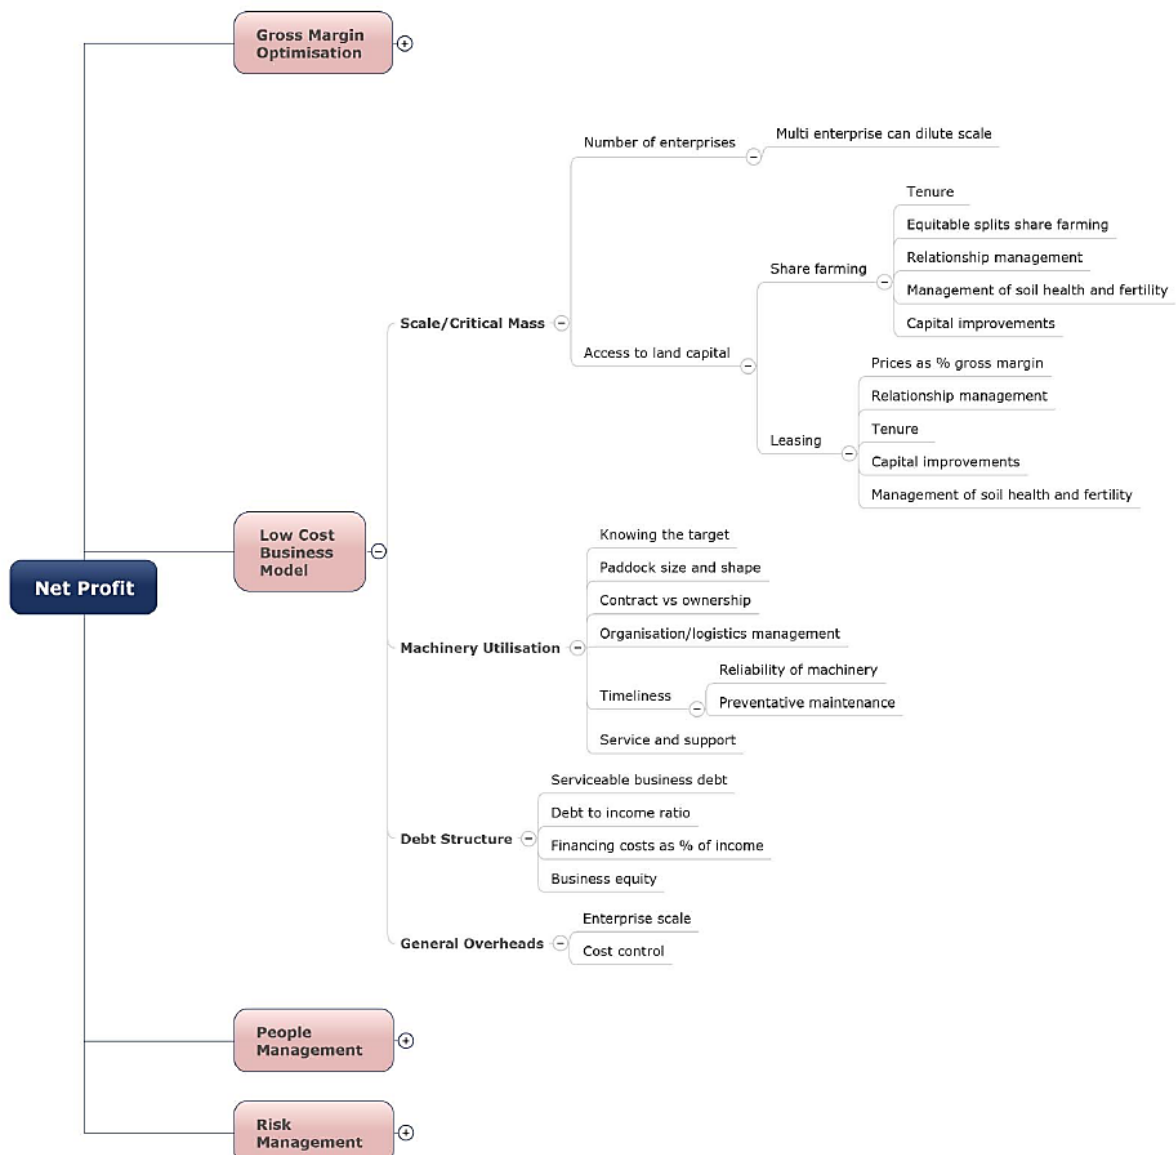

Chart 1: Breakdown of Variable Costs in the WA Central zone.

Low Cost Business Model

The Low Cost Business Model profit driver is influenced by a farms structural efficiency. This may include reaching a suitable scale or critical mass, be influenced by the aptitude to access and manage lease and/or sharefarm land, and potentially also the level of enterprise simplicity.

Machinery utilisation, and matching the investment in machinery to the size of the business operations, rather than business scale itself, also has an influence on

maintaining lower costs. Scale can be helpful with this, but is not the sole driver of machinery efficiency. Scale also has an influence on labour utilisation and maintaining lower general overhead costs.

Debt positioning with consideration of finance costs, and also values being paid to lease additional land may also have an influence on the low cost structure of the business.

Benchmark	Average across WA Central dataset	Average of Top 20% as selected by ORPA	Difference		Your Benchmarks
			+/-	%	
Total Plant Machinery Labour (TPML)					
a. TPML as a % income	25.47%	24.22%	-1.25%	-5.2%	
b. TPML \$/eff.Ha	\$164.68	\$159.27	-\$5.41	-3.4%	
TPML includes, wages, fuel & oil, machinery R&M, machinery/plant interest, machinery depreciation, contract work (incl hire & freight), imputed labour (permanent labour unit\$70,000)					
Machinery investment to income ratio	0.56	0.50	-0.06	-12.0%	
Area leased/sharefarmed %	37.09%	28.01%	-9.08%	-32.4%	
Land lease as a % gross margin	25.02%	18.76%	-6.26%	-33.4%	
Land Lease \$/Ha	\$86	\$67	-\$19	-28.4%	
Equity %	78.35%	84.45%	6.10%	7.8%	
Debt to Income ratio	0.72	0.58	-0.14	-24.1%	
a. Finance costs as a % income	5.29%	3.39%	-1.90%	-56.0%	
b. Land lease costs as a % income	5.13%	5.05%	-0.08%	-1.6%	
c. Combined costs as a % income	10.42%	8.44%	-1.98%	-23.5%	
EBIT (\$/Ha/mm AR)					
a. EBIT as \$/eff.Ha/mm AR	\$0.47	\$0.57	\$0.10	21.3%	
b. EBIT as \$/eff.Ha/eff.mm	\$0.62	\$0.83	\$0.21	33.9%	
Net Profit (\$/Ha/mm AR)					
a. Net Profit as \$/eff.Ha/mm AR	\$0.39	\$0.52	\$0.13	33.3%	
b. Net Profit as \$/eff.Ha/eff.mm	\$0.50	\$0.76	\$0.26	52.0%	

Table 3: WA Central Low Cost Business benchmarks.

In WA Central, the Top 20% of businesses by ORPA;

- ① Are more efficient with machinery and labour use (5.2%), as measured by TPML as a % of income.
 - This potentially allows an additional 1.25% of turnover to be retained as net profit before tax.
- ① Have a machinery investment to income ratio of 0.50:1.00, 12% lower than the average at 0.56:1.00.
 - This indicates that for every \$1 million of turnover, the Top 20% of businesses are employing \$500,000 of machinery (\$60,000 less than the average)
- ① Are leasing/sharefarming a lower percentage of farmed land (28% of land base managed) compared to the average (37% of land base managed). However the Top 20% are accessing lease land 33% more cost effectively when lease price is considered as a % of gross margin. The average business in the zone is paying 25% of gross margin to lease land, whereas the Top 20% of businesses are paying just below 19% of gross margin.
 - As an absolute \$/Ha figure, the Top 20% are paying 28% less to lease this land; \$67/Ha compared to \$86/Ha. Location and astute decision making influence this.
- ① Have finance and lease costs of 8.44% of income compared to 10.42% of income for the average business.
 - 96% of this difference is attributed to the finance costs.
- ① Have a debt to income ratio of 0.58:1.00 rather than 0.72:1.00.
 - This indicates a higher level of debt serviceability amongst the Top 20% by ORPA. Although, both debt to income ratios are solid, and manageable

TPML breakdown

It is interesting to compare the TPML cost components of the Top 20% of businesses with the average business. There is very little difference in TPML expenditure between the average and Top

20% businesses in this zone, however the Top 20% appear able to spread this over more cost effective lease land, and also appear to utilise more contracting in lieu of machinery ownership and operations.

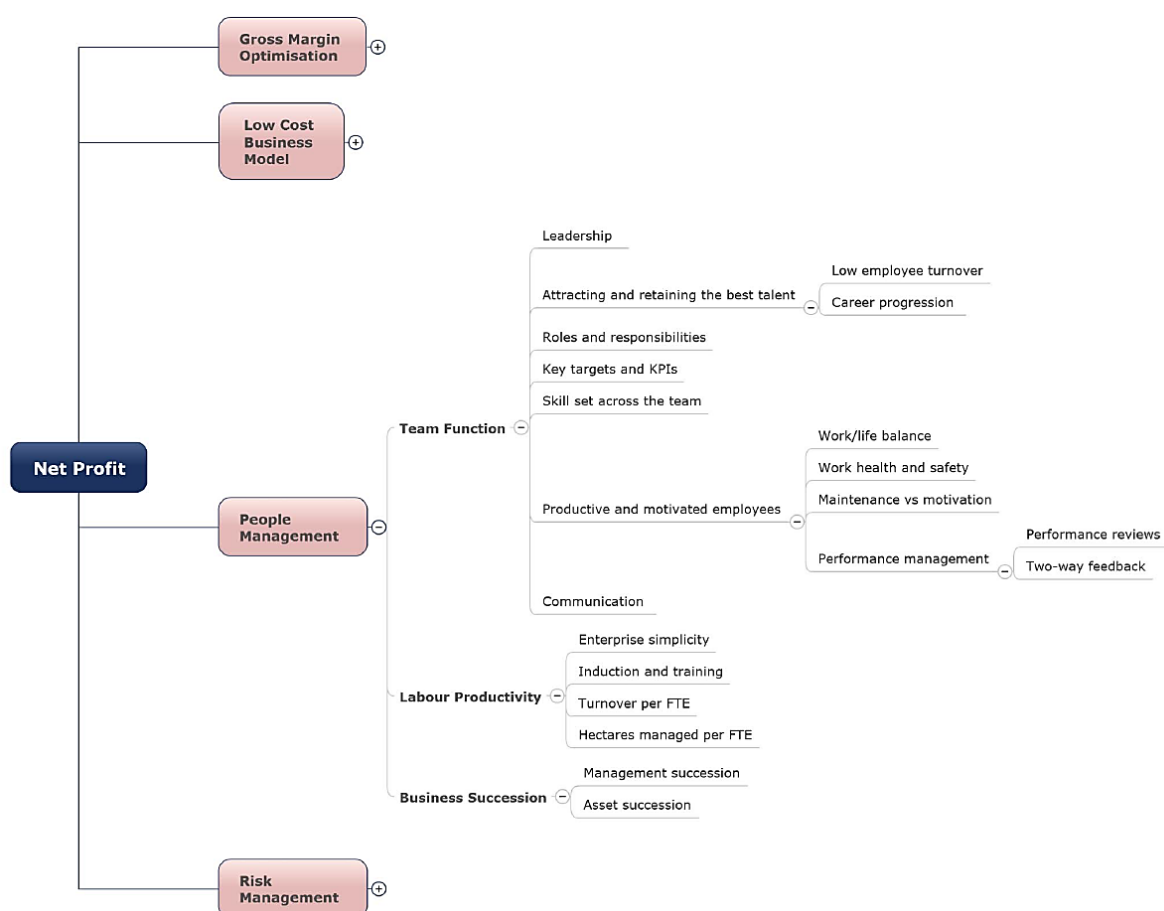

Chart 2: Breakdown of TPML Costs in the WA Central zone.

People and Management

The People and Management profit driver is influenced by the productivity of permanent and casual labour, business succession and management, and also the function of the team. Some aspects of function include the leadership, roles and responsibilities, communication, and skill

set across the production and management team. This profit driver can also be influenced by the ability of the business management to make the correct decisions for the business in high pressure situations.

Benchmark	Average across WA Central dataset	Average of Top 20% as selected by ORPA	Difference		Your Benchmarks
			+/-	%	
Turnover per FTE	\$891,066	\$916,333	\$25,267	2.8%	
Ha managed per FTE	1613	1478	-135	-9.1%	
Turnover per FTE per Ha	\$552	\$620	\$68	12.3%	

Table 4: WA Central People and Management benchmarks.

In WA Central, the Top 20% of businesses by ORPA;

- ① Are generating just over \$25,000 or 3% more turnover per FTE. Importantly, they are achieving this additional productivity with 9% less area managed per FTE.
- Analysed further, this equates to a 12% higher turnover per FTE per hectare
- ① The increase in turnover per FTE appears to be generally achieved via a combination of greater WUE, and

superior price received per tonne, along with superior enterprise scale (32% more area managed)

- And likely further influenced by non-benchmarked factors such as the skill set and management capacity of the Top 20% and their efficient people and management skills, leading to an increased productivity per hectare.

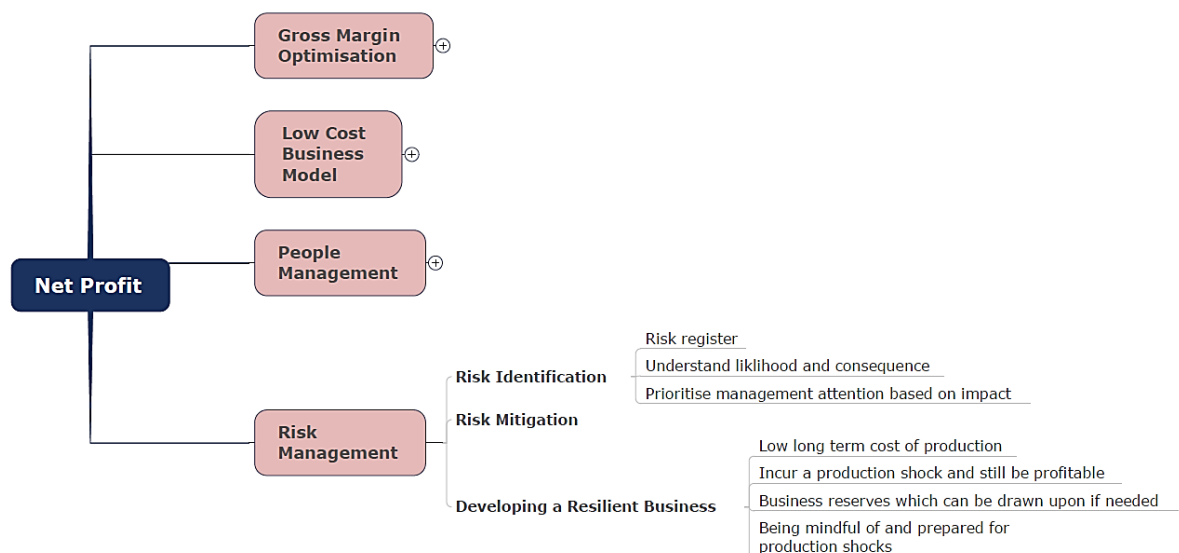

When it comes to People and Management, in all businesses there are five key functions that ensure positive

management outcomes. These are detailed in the graphic below.

Planning	Deciding what needs to happen in the future and generating plans for actions	<ul style="list-style-type: none"> 🕒 Operation preparation 🕒 Enterprise plan 🕒 Early is key
Organising	Making sure the human and nonhuman resources are put into place	<ul style="list-style-type: none"> 🕒 Is everything ready? 🕒 Is everyone informed? 🕒 Set targets? Stop:Go point
Coordinating	Creating a structure through which the farm businesses objectives can be accomplished	<ul style="list-style-type: none"> 🕒 Refer to the plan 🕒 Regular staff discussions 🕒 Work to objectives
Commanding	Determining what must be done in a situation and assigning people and time to do it	<ul style="list-style-type: none"> 🕒 Assign the right person 🕒 Outline task clearly 🕒 Time management
Controlling	Checking progress against plans	<ul style="list-style-type: none"> 🕒 Is everything going to plan? 🕒 Refine the plan? 🕒 Timeliness is key

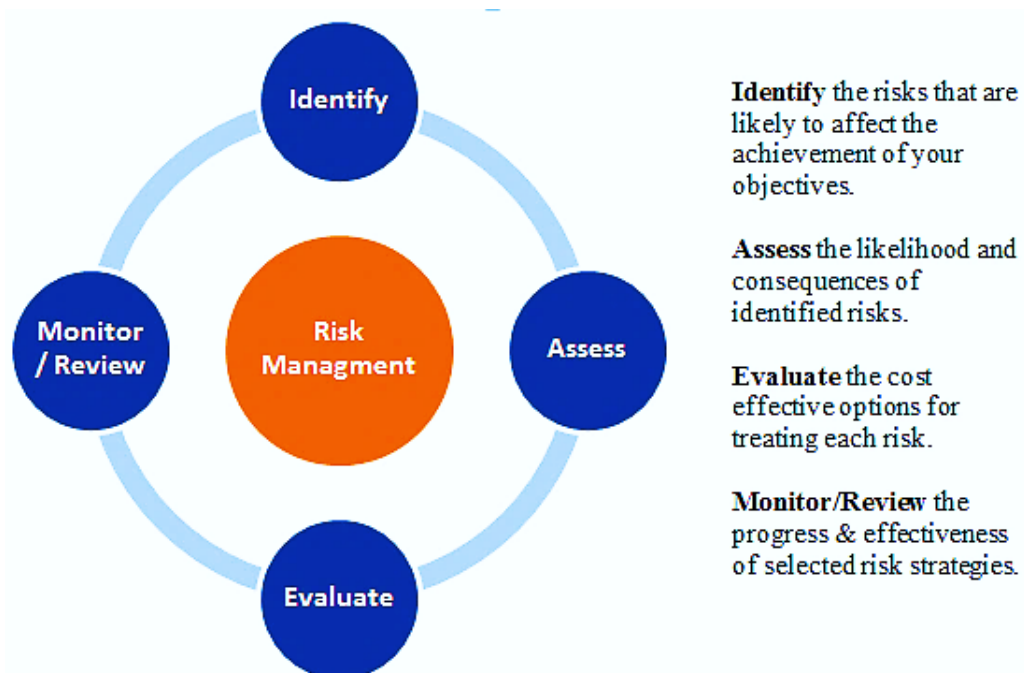

Risk Management

The Risk Management profit driver is a critical one. Developing a resilient business in agriculture is necessary to have capacity to absorb production and income shocks, yet still be able to maintain appropriate levels of financial performance. Within each production cycle and across all Australian crop production zones, businesses have to assess and respond to seasonal variation, commodity price fluctuation, and input

cost disparity. Beyond having the capacity to absorb changes in situational risk, a resilient business is one that can identify and mitigate key risks that may arise. Risk Management as a profit driver is also influenced by the other three primary profit drivers, but having the capacity and flexibility to proactively manage business risk is the major element in this profit driver.

The four step process in which a business can proactively manage risk is outlined in the graphic below

Stretch Targets

Stretch Targets of the key benchmarks in the WA Central zone are shown below. The 'traffic light' benchmarks provide an

indication of targets you should be looking to achieve based on the performance of businesses in this zone.

- Green** = In a good position
- Yellow/Orange** = In an 'OK' position, but there is area to improve
- Red** = Need to evaluate position, and assess methods of improvement

Profit Driver	Stretch target	Your Benchmarks
Variable costs as a % of Income (%)	47.5 50.0 52.5 55.0 57.5 	
TPML as a % of Income (%)	20.0 22.5 25.0 27.5 30.0 	
WUE Wheat (kg/ha/eff.mm)	8 10 12 14 16 	
Machinery Investment to Income	0.4 0.5 0.6 0.7 0.8 	
Turnover per Ha per FTE (\$)	400 475 550 700 850 	
Asset turnover ratio	0.2 0.25 0.3 0.35 0.4 	
Land lease as a % of Gross Margin (%)	20 30 40 50 60 	
Profit as a % of income (%)	15 20 22.5 25 30 	

*Methods of calculation for the above are shown on pages 28-30.

Fertiliser \$ per cropped ha (\$)	70 80 90 100 110 	
Pesticide \$ per cropped ha (\$)	50 52.5 55 57.5 60 	

What does it take to improve?

At risk of stating the obvious, maximising profit in any farm business comes down to three key principles. Irrespective of business scale, geographic location, financial position, or quality of

the farmland asset employed, these three principles drive the ability to produce the outcome for each individual situation. They epitomise what is defined as ‘management’.

These three principles are;

1. Discipline –

Diligent cost control and strategic marketing. Developing and sticking to a plan, but not being so rigid as to miss opportunities or waste resources should conditions change. Analysing and understanding your business in-depth will allow savings to be made; some may be small, but many small savings help generate a larger profit. Whilst strategic marketing will aid in ensuring sustainable profit margins. Yield and Price are by no means the sole profit drivers, look to focus more on Gross Margin maximisation and reducing business costs.

2. Application –

Matching resources to needs. Inputs, labour and machinery will be driven by numerous factors including average and unfolding seasonal conditions, availability of physical and financial resources, prevailing and developing

agronomic influences and requirements, and operational scale, but the overarching critical influence is to be aware of individual requirements and best matching necessities to minimise risk and costs. Develop and set reasonable targets and consistently meet these targets and you will in turn maximise profit.

3. Timeliness –

Plan and act. Implementing operations and tasks in a timely manner will not just increase efficiency and reduce costs, but will also reduce anxiety, and limit fatigue. The qualitative survey process demonstrated clearly that the technical information was available and flowing freely and growers knew what needed to be done; the key difference between average and better growers being the implementation discipline and ability. Timely implementation is the ultimate key to a profitable business.

Management Traits of the Top 20%

- ① Actively assess production and business risks
- ① Have a greater knowledge of the figures (risks & outcomes) related to each management operation
- ① Better understand individual enterprises
- ① Often have a simplified production system
- ① Have prepared a detailed paddock plan prior to the season commencing
 - Have a core rotation but with flexibility
- ① Establish a seasonal inputs & costs plan that allows for seasonal fluctuations
- ① Have the required inputs on hand, and labour in place early
- ① Have maintained, tried and tested all required machines prior to starting
- ① Are able to activate 'go' point without hesitation
- ① Have confidence in making, or sourcing, the 'right' agronomic decisions
- ① Understands the importance of monitoring crop growth and development stage
 - Allows timely nutritional applications
 - Allows timely pesticide applications
 - Allows timely implementation of other crop management tasks
- ① Know the fertility of their soils and requirements of crops
- ① Are able to manage staff effectively and proactively, to improve human resource efficiency
 - Understand the importance of training, supporting, and managing permanent and casual labour to ensure peak efficiency
- ① Are open to input from others and will discuss, rather than dismiss
- ① Are willing to be further informed and educated
 - Personal professional development, attend field days/trial walks, read respected media, keep abreast of (and understand) increasing technology options
- ① Understand their own strengths and weaknesses; personally and business wise
- ① Are willing to adopt and strategically implement technology
 - Numerous Decision Support Tools (DST's) available
- ① Maintain functional and efficient equipment; matched to scale and without significant underutilisation
- ① Use contractors to fill machinery/staffing/timeliness gaps
- ① Are willing to engage appropriate professionals
- ① Forward sell grain and market throughout the year
 - Understand various marketing options
 - Have a disciplined marketing plan
 - Monitor potential yield to evaluate sold position
- ① Appear to better be able to balance work commitments and family time
 - Reduce stress and fatigue

Prompt Outcome Case Studies

- Following are three case studies to highlight how some businesses can potentially, and often easily, achieve at least a \$25,000 to \$50,000 improvement in margins.

Case Study 1 – Seeding date

Seeding date is a common focus of many strategy reports and is well represented in cropping trials. Dry sowing is also becoming a more prevalent practice in a challenging environment. Trial results consistently show that an earlier seeding date will likely result in a more consistent germination, and more rapid plant establishment.

Do we really know the potential benefits of sowing early? There are numerous factors that can restrict or allow a grower to sow early i.e. soil type, weed burden, frost risk and others. But all of these can be managed.

A pro-active approach to pre and post-emergent weed control, choosing the right variety to sow early and good paddock preparation will all facilitate earlier seeding and the benefits that it produces. There are good Decision Support Tools (DST's) available to show the frost and heat risks associated with the optimal flowering window for production areas. One of the better DST's is called *Flower Power* developed by DAFWA.

To calculate a potential outcome of the effect of sowing date as follows;

For every day past the optimum sowing date, it is estimated you will incur an approx. 1% yield loss per day. This represents approx. 20kg/ha/day, and as it gets later into the optimum sowing period the yield loss can increase to 50kg/ha/day. If 50% of your cropping program is delayed by 7 days (and let's use the average cropped hectares in this zone of approx. 3,000ha and assume wheat), this equates to;

$$1,500\text{ha} \times 20 \text{ kg/ha/day} = 30,000 \text{ kg / day}$$

$$\times 7 \text{ days} = 210,000 \text{ kg (210 tonne)}$$

lower yield potential

$$@ \$274/\text{t (average price received)}$$

$$= \$57,000 \text{ loss (minimum) due to a delayed seeding date}$$

Case Study 2 – Chemical application

Weed control in modern reduced tillage farming systems is arguably the most important issue in most farming operations, and should have a high priority focus in the seasonal plan. A proactive weed control plan will not only benefit the current year's crop rotation, but will also heavily influence subsequent years cropping and rotation plans; and the profitability of the enterprise.

Controlling weeds early will ensure a crop has the greatest yield potential possible. It will also allow the option of dry sowing in subsequent years. There are many pest control manuals developed by private agronomy companies available that will aid in applying the correct chemical rate and mix. There are also other DST's, such as *WeedSeed Wizard* developed by DAFWA that give an indication of effects of control (or lack of) and potential crop losses now and in the future.

The following is a calculation of the potential effect and outcome of late weed control;

In general effective weed control occurs when the spray operation is completed within 6 weeks of sowing, and often this timeframe could be tighter. This minimises competition with the crop and also considers that smaller weeds are easier and cheaper to kill. If weed control is late, and poor chemical efficacy is realised, it can consistently incur yield losses of 0.5t/ha, and often more. Furthermore the associated costs of an additional spray pass and higher application rates needs to be considered. Even if 10% of the program is delayed when sprayed, then based on the average zone cropped hectares of approx. 3,000ha and assuming wheat, the following may apply;

**300ha x 0.5t/ha = 150t lower
yield potential**

@ \$274/t (average price received)

**= \$41,000 loss (minimum) due to
poor weed control**

Or

\$137 lower income per hectare

Case Study 3 - Nutrition

Soil nutrition and health are the building blocks of any profitable farming enterprise. It is essential to understand the health of soils and apply appropriate products to establish the right nutrient balance. It is not uncommon for farming businesses to be able to reduce fertiliser costs by \$25/ha (by tailoring fertiliser applications) when soil health is adequate. Based on the average cropped hectares in this zone of approx. 3000ha, this equates to;

3,000ha x \$25 per hectare = a potential of \$75,000 additional profit per year

Late applications of fertilisers can also be reducing yield and potential income. Crop yields are generally determined early in a plants life, particularly in wheat. Therefore there is added importance to soil test regularly to understand required nutrients and required application rates (to target average yield) so they can be applied early in the season; when most beneficial within 3 – 4 weeks after sowing when plant demand exists.

There are often benefits of later top-up fertiliser applications, and these decisions can be aided by professional agronomy advice and also numerous DST's such as *Yield Prophet*, *NuLogic plant tissue testing* and *Nitrogen Calculator*.

If growing conditions are adequate and fertiliser application occurs at optimal timing, then it is not unlikely to be able to achieve a 10% increase in yield. A 10% increase (or avoid a 10% decrease) in yield over the property can make substantial income gains and profit outcomes. A potential outcome of the effect of timely fertiliser application based on the average cropped hectares in this zone of approx. 3000 hectares and assuming wheat is;

**3,000ha x 10% yield benefit
(0.25t/ha [10% of average yield in this zone]) = 750t**

@ \$274/t (average price received)

**= \$205,000 additional income
(potential)**

Calculating Key Benchmarks

Effective Hectares (eff.ha) is a combination of both owned & leased land that is considered arable & useable

Overall Performance

Operating Return on Production Assets (ORPA)

= Farm Operating Profit _____
(Operating profit before interest & tax. Excludes capital growth)

÷

Total Farm Production Assets _____
(Value of owned land, value of leased land, value of stock, value of plant & machinery, and value of items on hand)

= _____

Gross Margin Optimisation

Water Use Efficiency (WUE)

Plant Available Moisture (PAM) = effective rainfall (apr-sept/oct) x 0.67 (evap. allowance) + stored moisture* (if determined available)

*Stored moisture maximums

Maximum Storage Capacity	
Soil Type	mm/metre
Light Sand	50
Good Sandplain (i.e. yellow)	80
Sandy Duplex	100
Loam	120
Clay/Loam	100
Clay	80

Asset Turnover Ratio

$$= \text{Gross Farm Revenue} \div \text{Total Business Assets}$$

(Includes both on-farm & off-farm assets. Does not include value of lease land)

$$=$$

Variable Costs as a % of Income

VC = crop costs: wages, fuel & oil, repairs & maintenance, contract costs, fertiliser, pesticides, seed/seed treatment, CBH charges

$$= \text{Variable Costs} \div \text{Farm Income}$$

$$=$$

Low Cost Business

Total Plant Machinery & Labour (TPML) as a % of Income

TPML = crop costs: wages, fuel & oil, repairs & maintenance, contract costs, machinery and plant interest, and permanent labour units*\$70,000

$$= \text{TPML} \frac{\text{_____}}{\text{_____}} \div \text{Farm Income} \frac{\text{_____}}{\text{_____}} = \frac{\text{_____}}{\text{_____}}$$

Machinery Investment to Income Ratio

$$= \text{Value of Plant \& Machinery} \frac{\text{_____}}{\text{_____}} \div \text{Gross Farm Revenue} \frac{\text{_____}}{\text{_____}}$$

→ a ratio of 0.5 indicates that for every \$1m of revenue,
The Grower is employing \$500,000 of machinery

$$= \frac{\text{_____}}{\text{_____}}$$

Land Lease as a % of Gross Margin

$$= \text{Land lease \$/ha} \frac{\text{_____}}{\text{_____}} \div \text{Operating gross margin/eff.ha} \frac{\text{_____}}{\text{_____}} = \frac{\text{_____}}{\text{_____}}$$

People and Management

Turnover per Ha per Full Time Equivalent (FTE)

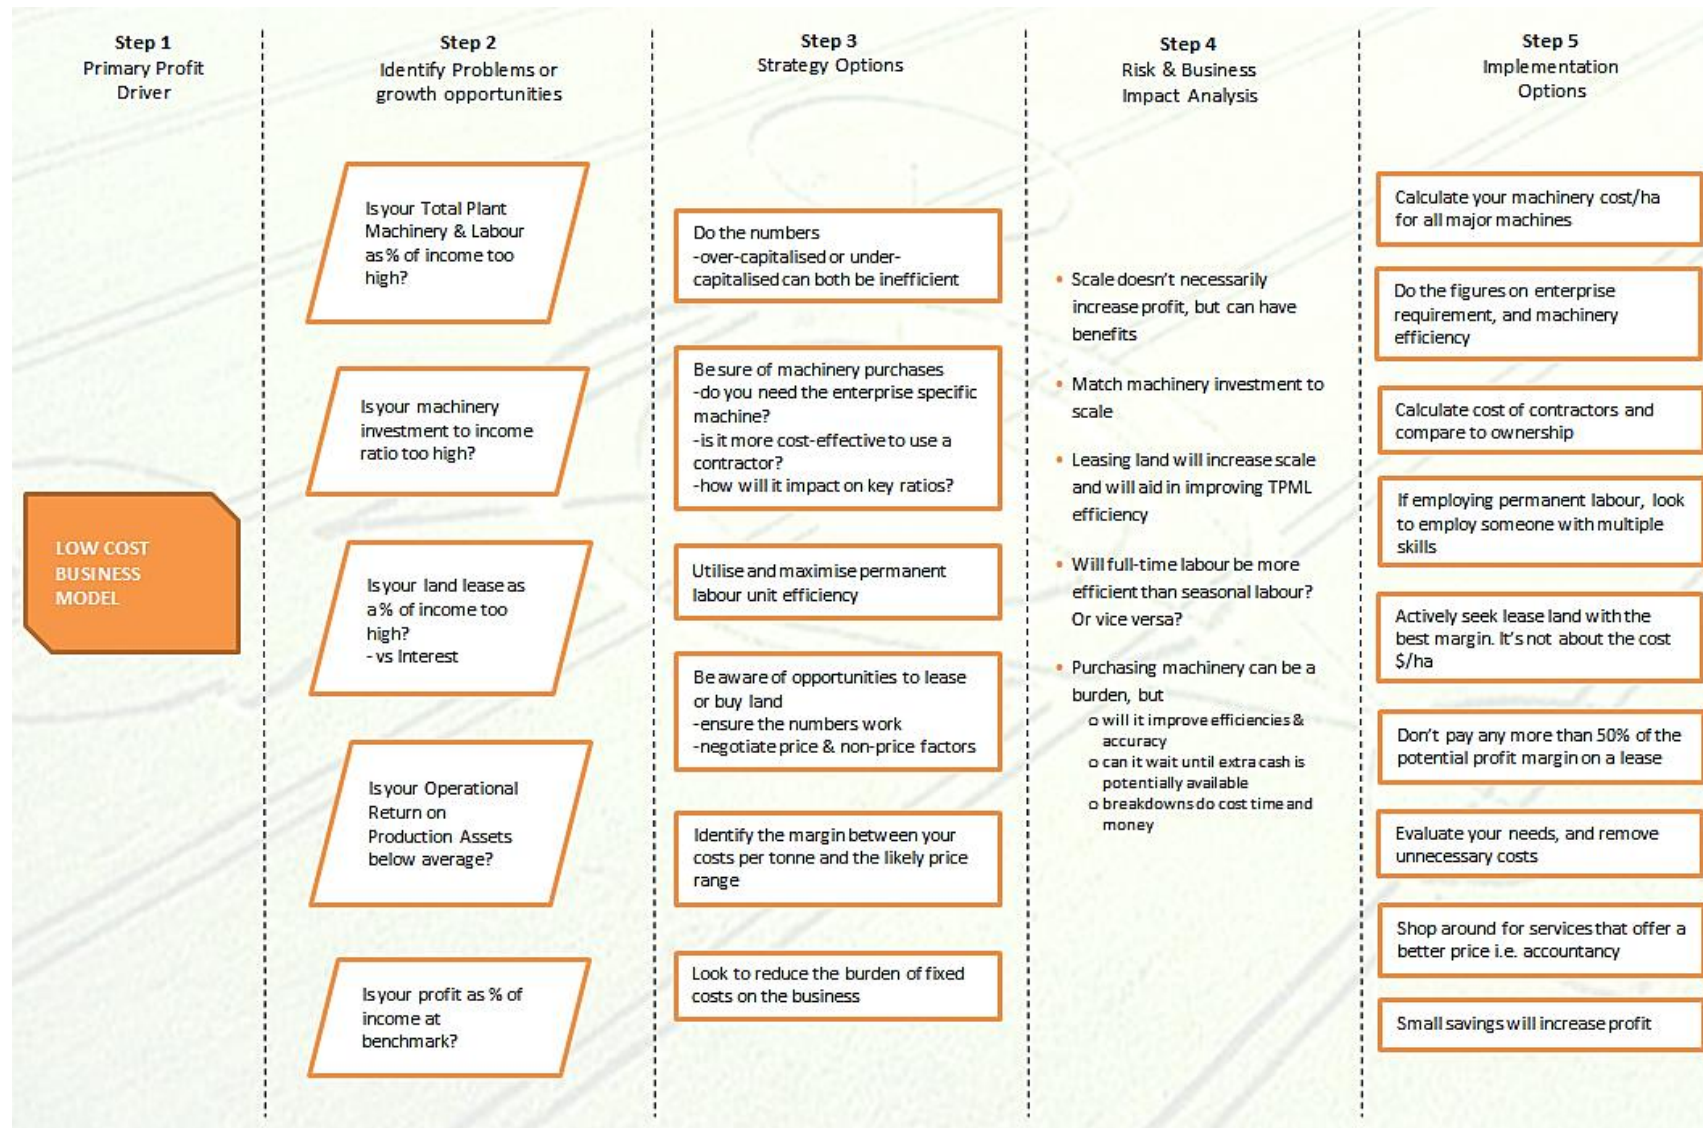

FTE = Full Time Equivalent

$$= \text{Farm turnover (income)} \frac{\text{_____}}{\text{_____}} \div \text{Full time labour units} \frac{\text{_____}}{\text{_____}}$$

$$= \frac{\text{_____}}{\text{_____}}, \div \text{eff.ha} \frac{\text{_____}}{\text{_____}} = \frac{\text{_____}}{\text{_____}}$$
